

Onboarding & Processor Credential — Failure Report

QA Automation findings for Dev review

Environment: test-web-admin.billeroo.com (Test)

Areas: Onboarding (merchant create), Processor Credential **Account:** Admin (Super Admin)

Observed: 2026-09-16 / 2026-09-17

Severity: High (blocking suite)

Summary

Two distinct failure signatures are blocking the Onboarding and Processor Credential suites:

- **(1) Created merchant not queryable in time** — after a merchant is created, it does not appear in the Onboarding table even after **8 reload + search cycles** (~60s+). The record IS created, it just surfaces later than the test can reasonably wait. backend slowness
- **(2) Navigation hangs on “Loading...” / never settles** — navigating to Onboarding waits on `networkidle`, but the SPA polls continuously so the network never goes idle → a hard **45s timeout**. wait strategy (partly test-side, partly slow nav)

Signature (1) is the same root cause already reported for Payment Console (records not queryable right after write). Signature (2) we have started mitigating test-side, but the underlying navigation is also slow.

8x

Reloads before
giving up (still not
found)

45s

Nav hang before
timeout

5

Failures (run
stopped at
maxFailures)

Created

Record exists, just
delayed

Where it fails

Signature 1 — create then read

Create merchant
submits OK

Reload + search
×8

Row still absent
⚠ not queryable yet

Signature 2 — navigate to Onboarding

Click "Onboarding"

nav starts

Wait networkidle

SPA polls forever

45s timeout

⚠ never idle

■ Works ■ Fails / hangs

Failures in the last run

Qase	Test	Failure reason	Type
3085	ECPAY credential created with valid input	Merchant not found in onboarding table after 8 reload attempts	slowness
3086	SSS credential created with valid input	Merchant not found after 8 reload attempts	slowness
3087	BRN credential created with valid input	Merchant not found after 8 reload attempts	slowness
3088	Payment Collection credential created	goToOnboarding: waitForLoadState('networkidle') 45s timeout	nav wait
3089	Local Gov of Davao credential created	goToOnboarding: waitForLoadState('networkidle') 45s timeout	nav wait

Earlier run (2026-09-16) showed the same signature (1) across merchant create/view/update tests: 2714, 2715, 2716, 2720, 2721.

Evidence

Signature 1 — record not queryable after 8 reloads

```
Error: Merchant "Test Business ISU1GD" not found in onboarding table
after 8 reload attempts
at OnboardModulePage.getMerchantDetails (blrOnboardingModulePage.ts:409)
```

The create step succeeds; the row simply hasn't become searchable within ~8 reload+search cycles. On slower moments it never appears inside the test budget.

Signature 2 — networkidle never fires (SPA polling)

```
TimeoutError: page.waitForLoadState: Timeout 45000ms exceeded.
===== logs =====
"domcontentloaded" event fired
"load" event fired
=====
at ProcessorCredentialPage.goToOnboarding (processorCredentialPage.ts:161)
```

domcontentloaded and load both fire — only networkidle never does, because the dashboard/SPA polls in the background continuously.

Impact

- **Automation:** Onboarding and Processor Credential smoke/regression suites fail at the create-then-read and navigate steps; the run hits maxFailures and stops early, blocking downstream tests.
- **Potential real users:** if a newly created merchant is not immediately queryable, users may not see the record right after saving and could re-submit.

What we've done test-side vs. what needs Dev

Test-side mitigations already applied:

- Reload + re-search up to 8 times after creation (still insufficient on slow moments).
- Replaced `networkidle` waits on the Onboarding navigation with a concrete element wait (the merchant "Search:" box) so navigation no longer hard-hangs.

What we need from Dev:

1. After a merchant/credential is created, how long until it is **queryable in the Onboarding list**? Is there a write→read replication lag, cache, or async index on the test env?
2. Is the **continuous background polling** expected? It prevents the network from ever going idle and slows perceived navigation.
3. Is this **test-infra slowness** or app behavior that would also affect production?

4. Expected **SLA** for “create → visible in list” so we can size the automation wait correctly.

Note: Signature (1) matches the previously reported Payment Console issue (records not queryable immediately after write) — likely the same backend cause. Signature (2) is partly a test wait-strategy issue (now being fixed) but is amplified by slow navigation on the shared test environment.

Prepared by QA Automation from live Playwright runs on the Test environment, 2026-09-16 / 2026-09-17.
